

**DEVICE AND ACTIVE COMPONENT FOR INHIBITING FORMATION OF
THROMBUS - INFLAMMATORY CELL MATRIX**

Wouter E. Roorda

5 ABSTRACT

A combination drug treatment for inhibiting stenosis or restenosis is disclosed. The combination treatment is an active component containing both an anti-inflammatory substance and an anti-thrombotic substance which, together, contribute to an inhibiting effect on the initial stages of stenosis or restenosis. The active component can be delivered to a site
10 of treatment by being carried on a device, such as a stent.
